

Looking after the site

Written for someone who can read code but hasn't done much web work. Nothing here needs a local setup — every change can be made in the browser, on github.com, by clicking the pencil icon on a file and pressing **Commit changes**. The live site rebuilds itself about a minute later.

Live site: <https://anirudhatalmale6-alt.github.io/manthas-food-palette/>

The shape of it

File	What it is
index.html	All the text and page structure
assets/style.css	All the styling. Plain CSS, no build step, no framework
assets/app.js	The lightbox, and the code that fills the galleries
data/posts.json	The feed. Written by the robot — never edit by hand
data/overrides.json	Your manual choices. This is the one you'll edit
scripts/sync-instagram.js	Reads Instagram, writes posts.json
.github/workflows/sync-instagram.yml	Runs the above twice a day

There is no database and no server. The whole site is three files plus pictures, which is why it costs nothing to host and can't really break.

Changing words on the page

Open index.html, find the sentence, change it, commit. That's the whole job.

The pieces you're most likely to want:

- The big headline — search for Three things
- The three section blurbs — search for sec-note
- The commissions line in the Art section — search for sec-cta
- Phone, email, WhatsApp — search for contact-list

Careful with — and ’ — those are an em dash and an apostrophe. Leave them as they are and type your text around them.

Changing a phone number or email

Two places each time: the text people see, and the link behind it.

```
<a href="tel:+6281291612480">+62 812 9161 2480</a>
<a
href="mailto:suvarnamantha@icloud.com">suvarnamantha@icloud.com</a>
<a href="https://wa.me/6281291612480">+62 812 9161 2480</a>
```

The WhatsApp link has no + and no spaces. The others keep the +.

Choosing the picture at the top

In data/overrides.json:

```
"heroPost": null
```

- null → the site uses her most recent photograph, by itself, forever.
- "17908223054189811" → that exact post is pinned there until you change it.

To find a post's id, ask me, or look it up in data/posts.json — each post has its permalink right next to its id.

After editing, the picture changes at the next sync (within twelve hours), or immediately if you run the sync yourself — see below.

Moving a post between Food and Art

Also data/overrides.json:

```
"sections": {  
  "17950446697588717": "art",  
  "17942856493589469": "art"  
}
```

Add a line with the post id and either "food" or "art". Anything listed here beats the automatic sorting, permanently.

Making the feed update right now

GitHub → **Actions** tab → **Sync Instagram feed** → **Run workflow**. Takes about a minute. It runs on its own twice a day anyway.

Showing like and comment counts

In data/posts.json the robot writes "showStats": false. Changing that by hand works until the next sync overwrites it — if you want them on permanently, tell me and I'll change it in the script.

The two things that can actually go wrong

1. The Instagram connection expires. The access token lasts 60 days. The robot renews it on every run, so in normal use this never bites. But if the sync stops running for two months — or if Suvarna changes her Instagram password, or switches the account back to Personal — the connection dies and the galleries freeze at their last good state. They won't go blank; the site keeps showing whatever it last fetched.

Fixing it means generating a new token at developers.facebook.com and putting it in **Settings** → **Secrets and variables** → **Actions** → **IG_TOKEN**. Message me and I'll walk you through it, it's the same ten minutes as the first time.

2. A sync fails. The Actions tab shows a red cross. The site doesn't change — the script is written to leave the last good feed in place rather than publish something broken. So a failed sync is never urgent.

What is deliberately not automatic

- **Both forms** (contact and astrology) are not connected to a mailbox yet. Submitting one says so honestly rather than pretending to send.
- **121 of the 220 reels cannot play on the site.** Instagram doesn't release the video file for those. They show the cover picture and a link instead. This is their restriction, not a setting I can change.

Anirudha Talmale, September 2026. Message me on Freelancer with anything — including “I’ve broken it”, which you almost certainly haven’t.
